SELECT \* FROM x WHERE fname LIKE '%\_id%' ORDER BY sname, fname A: The original problem with Oracle was that you were trying to use LIKE within an order by clause. Unfortunately this will fail. You need to use a subquery or join to return the rows you want. Something like: SELECT \* FROM (SELECT... FROM [some\_table]...) WHERE [some\_condition]; Will allow you to pass around filters and order clauses without worrying about interactions between them. Q: Trying to understand Linked Lists in C I'm trying to understand how linked lists work in C. The question I am stuck on relates to how data in a struct is stored in the linked list. struct stPoint { int a; int b; }; typedef struct stPoint pointType; Point \*makePoint(int a, int b){ pointType \*temp = (pointType \*)malloc(sizeof(pointType)); temp->a = a; temp->b = b; return point; } int main() { Point \*a = makePoint(1,2); Point \*b = makePoint(5,4); Point \*c = makePoint(3,3); Point \*head = NULL; list(a); list(b); list(c); printf("Head = %p ", head); return 0; } void list(Point \*head) { Point \*next = head; while(next!= NULL){ printf("next = %p ", next); next = next->next; } } The problem that I am having is that in the list function, I am passing in a pointer to a pointer to the struct stPoint and then after the list function is complete, f678ea9f9e
